# Qualitative research tools and data analysis

by Pr. Saliha Chelli

#### **Lecture Objectives**

In this lecture, students will

- be introduced to qualitative tools
- -be introduced to the process of qualitative data analysis

# 1. Qualitative data collection methods

#### The main methods are:

- □ interview,
- □ focus group,
- □ observation,
- collection of documents such as diaries,
   photographs, collection of narrative, journals,
- the think aloud method and
- open questionnaires.

## 1.2 Interviews

#### There are three main kinds of interviews:

- □ The structured interview is one in which the content and the procedures are organized in advance.
- This means that the sequence and wording of the questions are determined by means of a schedule and the interviewer is left little freedom to make modifications.
- □ It is characterize by being closed.
- This kind of interview is used in situation where a written questionnaire would in theory be adequate except that for some reason the written format is not feasible (for example, because of the low level of literacy amongst the participants or the need to tighten control as in some market surveys or opinion poll) (DÖrneiy, 2007: 135).

□ This kind of interview is used in situations where a written questionnaire would in theory be adequate except that for some reason the written format is not feasible (for example, because of the low level of literacy amongst the participants or the need to tighten control as in some market surveys or opinion poll) (DOrneiy, 2007: 135).

## The semi-structured interview

- □ The semi-structured interview is the most common qualitative data gathering tool during which the person being interviewed is the expert and the interviewer the student.
- This kind of interview involves a number of open ended questions based on the topic areas that the researcher wants to cover. The open ended nature of questions posed defines the topic under investigation but provides opportunities for both interviewer and interviewee to discuss some topics in detail.
- ☐ If the interviewee has difficulty answering a question or provides only a brief response, the interviewer can use cues or prompts to encourage the interviewee to consider the question further.

□ A good interviewer needs to be able to put the interviewee at ease, needs good listening skills and needs to be able to manage an interview situation so as to collect data which truly reflect the opinions and feelings of the interviewee concerning the chosen topic.

## The unstructured interview

- □ The unstructured interview is an open situation having greater flexibility and freedom.
- □ It is similar to a free flowing conversation. Not detailed interview guide is prepared in advance, although the researcher usually thinks of a few (1-6) opening questions.
- During the interview, the researcher may ask an occasional question for clarification and may give reinforcement feedback, but interruption are kept to the minimum (Dorneiy, 2007: 136).
- □ For an unstructured interview to be successful, the interviewer needs to establish good rapport with the interviewee.

# 1.2.1. Preparing for the Interview and designing the interview guide

- □ The complete interview process involves a series of carefully designed steps after having chosen the sample.
- ☐ The preparation of an interview guide containing a few relevant questions is necessary.
- □ A good interview guide requires careful planning followed by piloting (Dorneiy, 2007, p. 136).

# 1.2.2. Question Types

- □ The first few questions can be **factual questions** (family, job) to set the tone and create initial rapport.
- □ Content questions: experiences and behaviours, opinions and values, feelings, knowledge, sensory information (what has someone seen, heard...), background or demographic information.
- These categories concern different aspects of the participants overall view/ experience of the phenomenon and then we can get a rounded picture by including in our interview guiding questions that tap into each dimensions.

- **Probes** may include detailed oriented and clarification questions to increase the richness and depth of the responses.
- The final **closing questions**. This permits the researcher to have a final say. Simple questions such as 'Is there anything you like to add' or 'What should I have asked you that I didn't ask you?'

# 1.2.3. Recording the interview

Some key issues of interview conduct are helpful such as:

- □ Recording the interview
- □ Starting the interview (the first few minutes are important to set the tone/ climate of the interview).
- We must show that we are really interested in what the interviewee has got to say and that we are a nice and reasonable and non-threatening person.
- □ Before starting the recording, we need to explain again the purpose for the interview.

# 1.2.4. Conducting the interview

- A good qualitative interview has two features:
   a) It flows with the various parts connecting seamlessly.
- □ We must remember that we are there to listen (not to speak).
- □ B) It is rich in detail; it is an area where the skilful use of various probes can make a real difference.

# 1.3. Focus Groups

Focus groups - as the name suggests- involve a group format whereby the researcher records the responses of a small group (usually 6-12 members). The focus group is based on the collective experience of brainstorming, that is, participants thinking together, inspiring and challenging each other, and reacting to the emerging issues (Dorneiy, 2007: 144).

## 1.4. Observation

- □ The distinctive feature of observation as a research process is that it offers an investigator the opportunity to gather 'live' dada from naturally occurring social situations.
- □ Observation, too, can be structured, semi-structured or unstructured.
- The structured observation is useful for testing hypotheses while the semi-structured and unstructured provide a rich description of a situation which, in turn, can lead to subsequent generation of data.

## 1.4.1. Classroom Observation

To organize the many different ways in which we can observe classrooms, two dichotomies are usually offered:

□ 'structured versus unstructured'. These are very similar to quantitative and qualitative distinction in observation terms.

- □ The first one is highly structured and involves going to the class with a specific focus and with concrete observation categories,
- □ whereas the unstructured is less clear; the researcher needs to observe first what is taking place before deciding on its significance for research.

- □ The former involves completing an observation scheme,
- □ while the latter involves completing narrative field notes, often supplemented by maps or diagrams (*Dorneiy, 2007*, p. *179*).

□ Schemes – similar to questionnaires- have a range of systematic categories which allow the observer to record events quickly by using tally marks (*Dorneiy*, p. 180). Schemes also need to be piloted

#### Classroom Observation Form

Demonstrator:	Specialization:
Peer/Observer:	Date and Time:

	Review Section	Description/Comments
1.	SUBJECT MATTER CONTENT (shows good command and knowledge of subject matter; demonstrates breadth and depth of mastery.	
2.	ORGANIZATION  (organizes subject matter; evidences preparation; is thorough; states clear objectives; emphasizes and summarizes main points, meets class at a scheduled time, regularly monitors on-line course)	
3.	• • •	
4.	TEACHING METHODS  (uses relevant teaching methods, aids, materials, techniques, and technology; includes variety balance, imagination, group involvement, uses examples that are simple, clear, precise, and appropriate; stays focused on and meets stated objectives)	
5.		

#### In planning observations, one has to consider the following:

- □ When, where, how and what to observe
- □ How much degree of structure is necessary in the observation
- ☐ The duration of the observation, which must be suitable for the behaviour to occur and be observed
- □ Timing of the observation period
- □ The context of the observation
- □ The nature of the observation (structures, semi-structures, unstructured)
- □ The need to choose the appropriate kind of recording (Cohen *et.al.*, 2007.

#### 1.4.2 Techniques for collecting data through observation

- □ Written descriptors: the researcher can record observations of people, a situation or an environment by taking notes of what has been observed.
- □ **Video recording**: this frees the observer from the task of taking notes
- Artefacts: artefacts are objects which inform us about a phenomenon under study because of their significance to the phenomenon. Examples would be the doctor's equipment in a particular clinic or art work hung in residential care homes.

# 1.5. Qualitative Data Analysis

- What is meant by analysis: after the mass of words are generated by interviews or observational data, they need to be described and summarised.
- □ It may require from the researcher to seek relationships between various themes that have been identified.
- □ Finally, the results are presented, generally as a descriptive and interpretive account of the data.

# 1.5.2. Data analysis process

- The analysis of qualitative data usually goes through some or all of the following stages:
- □ Familiarisation with the data through review, reading, listening...
- □ Transcription of tape recorded material: it is the full script of an interview or a conversation, or the procedure of producing a written version of these methods.

#### TRANSCRIPTIONS

- 5 You give so sweder gold spinished
- T Ob, quit, shi Nit, su, not maky ... It's not going to be a quite maky ... noty ... lost, not, what's talky. Torolog is in principal.
- 5 Yes (reposaling)
- I died in Thursday, if you this ... same as before ... only FI think up note new questions—the other most wave too easy ... use, okey, or FI take next questions from, or, from newspapers over the last few world, right' no means post'er get to worth the news and stud the newspaper and remainless what's going on ... If you do, you'll win ... if not, well, that's life tergonistes;
- 5. Will be better from TV (securing) (laughter)
- T. Britis the TVF . . . What, my what programms . . . (all trials)
- Sc. Nors, seen (repending).
- T Did you my ... P.Oh, ob, we'll been, or, in'll be the n. . . . . It'll be the more destrict to different ... Prof. form? In different ... I Different Different The quantum will be on different ... . what Different (plants):
- 5 Tells (repossing)

- provides detailed evidence on specific aspects of classroom interaction
- can be analyzed through coding (category systems)
- \* time-consuming

- Organisation of data: after the transcription, it is necessary to organise the data into easily retrievable sections
- Coding (called indexing): for example, sections of text transcripts may be marked by the researcher in various ways: underlining in a coloured pen, highlighting, giving a numerical reference, or bracketed with a textual code in the margin.
- □ Identification of themes
- □ Development of provisional categories
- □ Exploration of relationships between categories, finding possible and plausible explanations for findings
- □ Report writing

## Qualitative data process

### CODING

- Coding can be done in any number of ways,
   e.g. assigning a word, phrase, number, symbol or color to each coding category.
- Coding can also be done by color coding different categories on transcript and field notes or cut text segments and place them on note cards.
- It uses labels to classify and assign meaning to pieces of information.

## A Visual Model of the Coding Process in Qualitative Research

1

# 1.5. 3. Computer software packages for qualitative analysis

Various packages have been developed to allow the researcher to organize, code and and search data such as ATLAS.ti, used for large bodies of textual, graphical and audio and video data. C

MAXQDA is another world-leading software for qualitative data analysis.

### The software helps in:

- □ Data storage and management
- Data searching and retrieval
- □ Coding
- Developing and testing theory
- Writing reports

However, they cannot replace the human as they lack the capacity to think, reflect and Analyse.

# Test yourself

- □ What is the difference between an interview and a focus group?
- □ Can these qualitative tools be used in quantitative research?
- Explain the term 'probe'.
- □ How can you code the data?
- □ How can you identify themes in an interview?
- □ Explain briefly what is meant by: open coding, axial coding and selective coding.
