

## Tutorial N°3: Exercises on spherical diopters and thin lenses.

### Exercise 3.1:

A spherical diopter with top S and center C separating 2 media with indices  $n = 1$  and  $n' = 4/3$  has a radius of curvature  $|r| = 4$  cm.

1) Write the formulas of the spherical diopter without demonstration: conjugate formula, transverse magnification and focal lengths.

2) This diopter gives an image  $A'B'$  ( $p' = \overline{SA'}$ ) of a real object  $AB$  ( $p = \overline{SA}$ ) such that the magnification  $\gamma$  is equal to +2.

a- Calculate the distances  $p$  and  $p'$  and on a scale figure, place the points S, C, A and  $A'$ .

b- Calculate the focal lengths  $f$  and  $f'$ .

c- Is the diopter convergent or divergent; convex or concave? Place S, C, A,  $A'$ ,  $f$  and  $f'$  in axe  $xx'$ .

### Solution

1- Conjugate formula: 
$$\frac{n'}{p'} - \frac{n}{p} = \frac{(n' - n)}{r}$$

Transverse magnification: 
$$\gamma = \frac{n}{n'} \frac{p'}{p}$$

Image focal length: 
$$f' = \frac{n'r}{n' - n}$$

Object focal length: 
$$f = \frac{-nr}{n' - n}$$

a) We obtain: 
$$\gamma = 2 = \frac{3p'}{4p} \Rightarrow p' = \frac{8}{3}p$$

We replace:  $p' = \frac{8}{3}p$  in the Conjugate formula, we find:

$$\frac{4}{3p'} - \frac{1}{p} = \frac{1}{3r} = \frac{1}{2p} - \frac{1}{p} = -\frac{1}{2p} \Rightarrow p = -\frac{3r}{2}$$

$p$  is negative, the object is real and the image is virtual. So  $r > 0, r = 4 \text{ cm}, p = -6 \text{ cm}$  and  $p' = -16 \text{ cm}$ .

c)  $f' = 16 \text{ cm}$  and  $f = -12 \text{ cm}$ . The diopter is convergent and convex.

### Exercise 3.2:

A spherical diopter with a radius of curvature of 10 cm separates two media with indices  $n = 1$  and  $n' = 3/2$ .

Determine the position of the focal lengths, Calculate and draw the position of the image of an object AB.

Place a:

- a) 60 cm from the top and real;
- b) 10 cm from the top and real;
- c) 5 cm behind the diopter (virtual object).

Same questions if we reverse the indices

### Solution

We suppose ( $p' = \overline{SA'}$ ) and ( $p = \overline{SA}$ )

a)  $r$  is positive, the diopter is convergent. We then have  $\overline{SF} = f = -2r = -20 \text{ cm}$  and

$$\overline{SF'} = f' = 3r = 30 \text{ cm.}$$

If  $\overline{SA} = -60 \text{ cm}$ ,  $\overline{SA'} = 45 \text{ cm}$ . The image is real and reversed

a) If  $\overline{SA} = -10 \text{ cm}$ ,  $\overline{SA'} = -30 \text{ cm}$ . The image is virtual in the same side as the object.

c) If  $p=5 \text{ cm}$ ,  $p' = 6 \text{ cm}$ . The object is virtual and the image is real

If we reverse the indices,  $f' = -20 \text{ cm}$  and  $f = 30 \text{ cm}$ . The diopter is divergent.

a) If  $p = -60 \text{ cm}$ ,  $p' = -13.33 \text{ cm}$ . The object is real and the image is virtual in the same side as the object.

- b) If  $p = -10$  cm,  $p' = -5$  cm. The object is real and the image is virtual in the same side as the object.

- c) If  $p = 5$  cm,  $p' = 4$  cm. The object is virtual and the image is real.

### Exercise 3.3:

A lens forms an image of an object 20 cm away from it. The image is at 6 cm from the lens and on the same side as the object.

- What is the focal length of the lens?
- Determine the nature of the lens.
- If the object is 0.4 cm in size, what is the size of the image?
- Determine the nature of the image.
- Make the diagram

### Solution

a)  $\overline{OA} = -20$  cm and  $\overline{OA'} = -6$  cm

Conjugate formula:  $\frac{1}{OA'} - \frac{1}{OA} = \frac{1}{OF'} = \frac{1}{f'}$  given  $f' = -8.57\text{cm}$

b) It is a divergent lens,  $OF' < 0$

c) The magnification is given by:

$$\gamma = \frac{A'B'}{AB} = \frac{OA'}{OA} = \frac{p'}{p} = 0.3, A'B' = 0.12\text{cm}$$

d) It is a virtual image, straight and reduced 0.3 times.

e) Diagram

### Exercise 3.4:

1. When the lens is convergent, complete the following constructions:

1. When the lens is divergent, complete the following constructions:

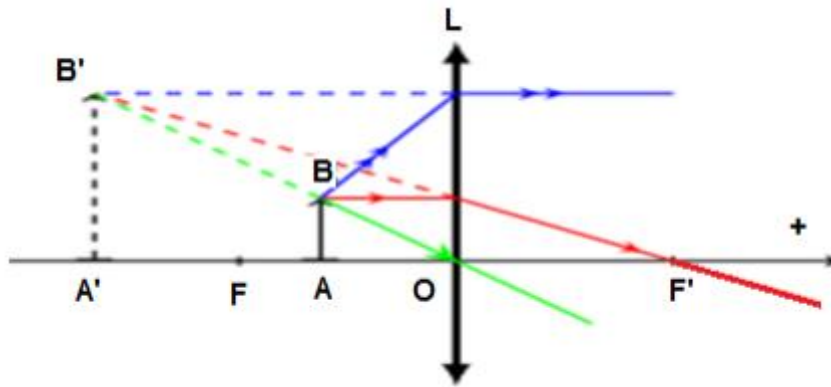

## Solution

1. Construction of the image by a converging lens of an object

a- A real object, right reversed image

b- Real object, virtual image

c- Virtual object, real image

2. Construction of the image by a lens diverging from an object

a- A real object, right virtual image

b- A virtual object, real right image

c- A virtual object, reversed virtual image
