Applied Achitectural Structures: Structural Analysis and Systems arch 631 Dr. Anne Nichols Spring 2018

three

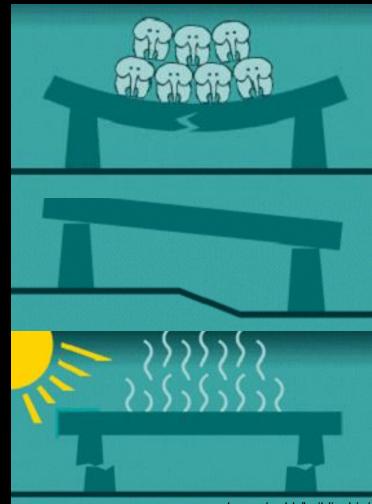

design codes, building codes

Applied Architectural Structures ARCH 631

Structural Requirements

- serviceability
 - strength
 - deflections
- efficiency
 - economy of materials
- construction
- cost
- other

www.pbs.org/wgbh/buildingbig/

Applied Architectural Structures ARCH 631

Structure Requirements

 strength & equilibrium - safety - stresses not greater than strength - adequate foundation

Figure 1.16 Equilibrium and Stability?—sculpture by Richard Byer. Photo by author.

Applied Architectural Structures ARCH 631

Structure Requirements

- stability & stiffness
 - stability of components
 - minimum
 deflection and
 vibration
 - adequate foundation

Figure 1.15 Stability and the strength of a structure—the collapse of a portion of the UW Husky stadium during construction (1987) due to a lack of adequate bracing to ensure stability. Photo by author.

Applied Architectural Structures ARCH 631

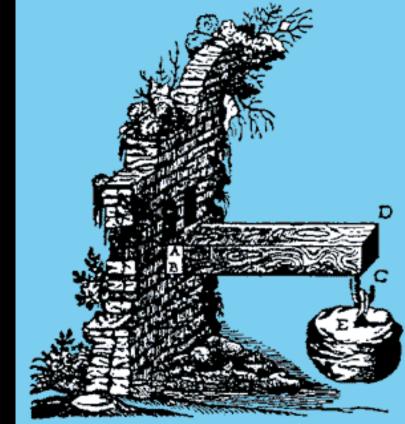

Structure Requirements

- economy and construction
 - minimum material
 - standard sized
 members
 - simple connections and details
 - maintenance
 - fabrication/ erection

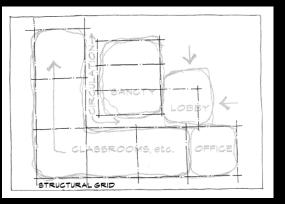

- planning
- preliminary structural configuration
- determination of loads
- preliminary member selection
- analysis
- evaluation
- design revision
- final design

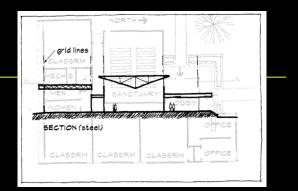

- planning to establish
 - function of structure
 - criteria for optimum design
 - code jurisdiction
- preliminary structural configuration
 - arrangement of elements within form
 - columns
 - beams
 - joists
 - trusses

Applied Architectural Structures ARCH 631

- determination of loads
 - structure weight
 - moving loads
 - severe, rare loads

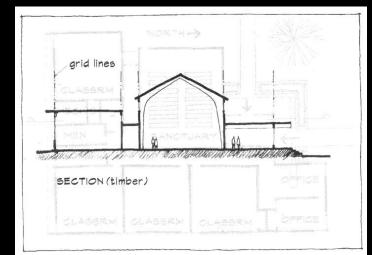

building codes

- preliminary member selection
 - based on configuration, determine loads on individual elements
 - determine internal forces & stresses
 - choose section to satisfy primary strength requirement

- analysis
 - actual structure weight
 - with other loads
 - based on structural system / modeling
 - elements columns, beams...
 - connections
 - systems frames, trusses
 - deflections and deformations
 - different load combination?
 - pattern loading

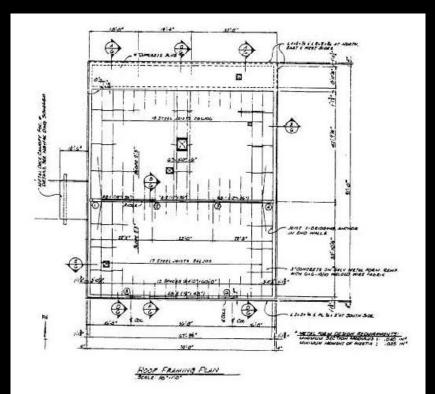

- evaluation
 - measure results against criteria
 - strength?
 - deflections?
 - economy?
- revise design
 - any criteria NOT met

 change member sizes, material, arrangement

- final design
 - analyze revised design
 - evaluate and meets
 requirements

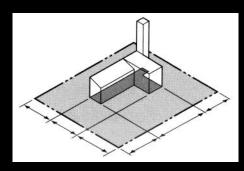

- draw structural plan

Applied Architectural Structures ARCH 631

Building Codes

- documentation
 - laws that deal with planning, design, construction, and use of buildings
 - regulate building construction for
 - fire, structural and health safety
 - cover all aspect of building design
 - references standards
 - acceptable minimum criteria
 - material & <u>structural</u> codes

Building Codes

- occupancy
- construction types
- structural chapters

 loads, tests, foundations
- structural materials, assemblies
 - roofs
 - concrete
 - masonry
 - steel

	OCCUPANCY OR USE	UNIFORM (psf)	CONCENTRATED (lbs.)
-	OCCONTRICT ON COL	(par)	(103.)
1.	Apartments (see residential)		_
2	Access floor systems		
-	Office use	50	2,000
ļ			
	Computer use	100	2,000
3.	Armories and drill rooms	150	
4	Assembly areas and theaters		
	Fixed seats (fastened to floor)	60	
	Lobbies	100	
	Movable seats	100	
Į.,	Stages and platforms	125	
5	Follow spot, projections and	50	
	control rooms		
	Catwalks	40	
_			

Building Codes

- adoptable codes
 - Southern Building Code Congress International (SBCCI)

- Building Officials & Code Administrators
 International (BOCA)
- International Conference of Building Officials (ICBO - UBC)
- International Building Code (IBC)
 - attempt to get one unified code in 2000

IBC

Code Reduction of Live Loads

- for (ordinary) live loads
 - factored area supported \geq 400 ft²
 - reduction can't exceed
 - 0.5L_o (one floor) or 0.4L_o (more)

$$L = L_o \left(0.25 + \frac{15}{\sqrt{K_{LL}A_T}} \right)$$

- for live loads > 100 lb/ft²
 live load reduction of 20% on columns
- for (ordinary) roofs: $L_r = L_o R_1 R_2$ - 12 lb/ft² $\leq L_r \leq$ 20 lb/ft²

Design & Codes 15 Lecture 3

Standards

- criteria for quality
 - American National Standards Institute (ANSI)
 - American Society of Testing and Materials (ASTM)
- materials

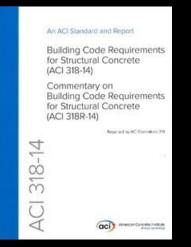

- Portland Cement Association (PCA)
- National Concrete Masonry Association (NCMA)

Structural Codes

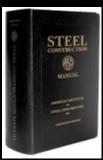

- prescribe loads and combinations
- prescribe design method
- prescribe stress and deflection limits
- backed by the profession
- may require design to meet performance standards
- related to material or function

Structural Codes

- American Concrete Institute (ACI)
- American Institute of Steel Construction (AISC)
- Precast/Prestressed Concrete Institute
 (PCI)
- Post Tensioning Institute (PTI)
- Structural Joist Institute (SJI)

National Design Specifications (NDS)
 – American Wood Council

Design

- factors out of the designer's control
 - loads
 - occurrence

- factors within the designer's control
 - choice of material
 - "cost" of failure (F.S., probability, location)
 - economic design method
 - analysis method

- different approaches to meeting strength/safety requirements
 - allowable stress design (elastic)
 - ultimate strength design
 - limit state design
 - plastic design

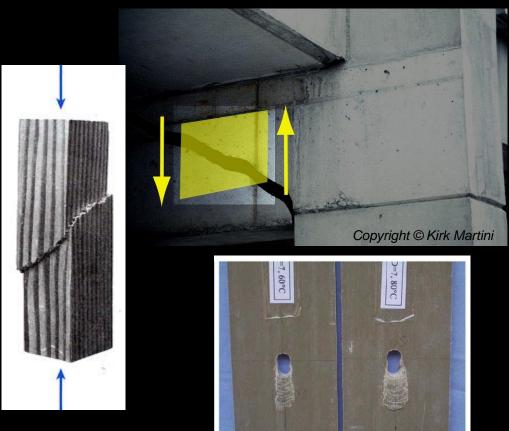

– load and resistance factor design

 assume a behavior at failure or other threshold and include a margin of safety

http://mceer.buffalo.edu

- structures and connections see
 - shear
 - bending
 - bearing
 - axial stress
 - compression
 - tension
 - torsion

Applied Architectural Structures ARCH 631

- materials have a critical stress value where they could break or yield
 - ultimate stress
 - yield stress
 - compressive stress
 - fatigue strength
 - (creep & temperature)

acceptance vs. failure

www.historychannel

 material behavior

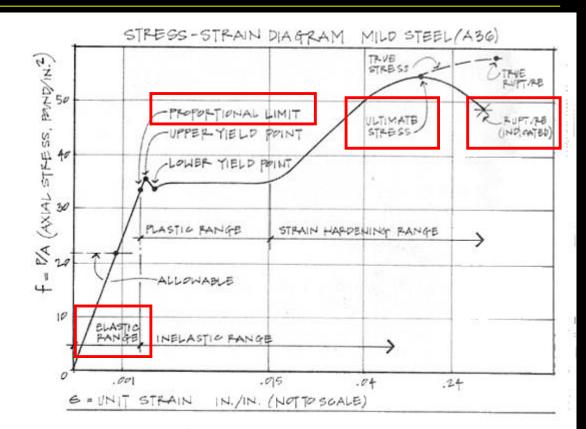

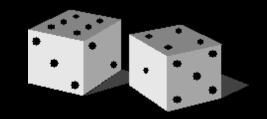

Figure 5.22 Stress-strain diagram for mild steel (A36) with key points highlighted.

- allowable stress design
 - elastic range
 - factor of safety (F.S.)

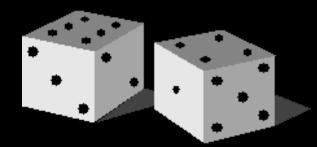

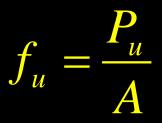

$$f_{actual} = \frac{P}{A} \leq f_{allowed} = \frac{f_{capacity}}{F.S.}$$

- probability of loads and resistance
 material variability
- overload, fracture, fatigue, failure

- load and resistance factor design (LRFD)
 beyond allowable stress
- materials aren't uniform 100% of the time

 ultimate strength or capacity to failure may be
 different and some strengths hard to test for
- RISK & UNCERTAINTY

Applied Architectural Structures ARCH 631

- loads on structures are
 - not constant

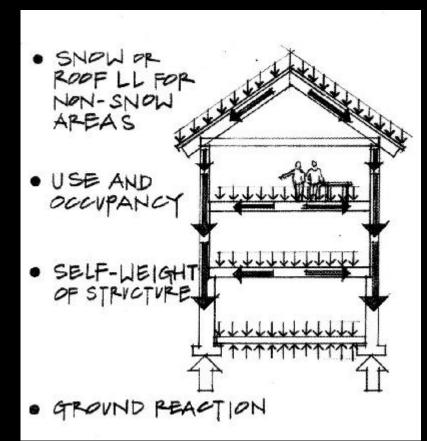

- can be more influential on failure
- happen more or less often
- UNCERTAINTY

$$\gamma_D P_D + \gamma_L P_L \le \phi P_n$$

 ϕ - Resistance factor γ - Load factor for (D)ead & (L)ive load

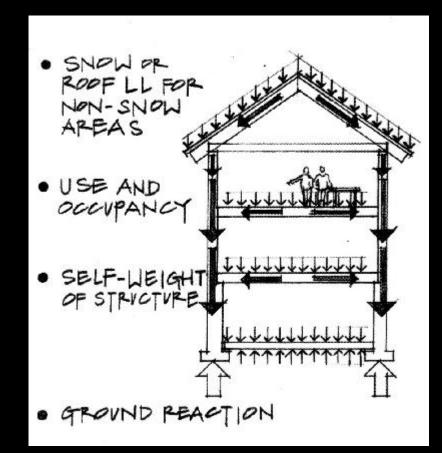

Loads

- gravity acts on mass (F=m*g)
- force of mass
 - acts at a point
 - ie. joist on beam
 - acts along a "line"
 - *ie. floor on a beam*
 - acts over an area
 - *ie. people, books, snow on roof or floor*

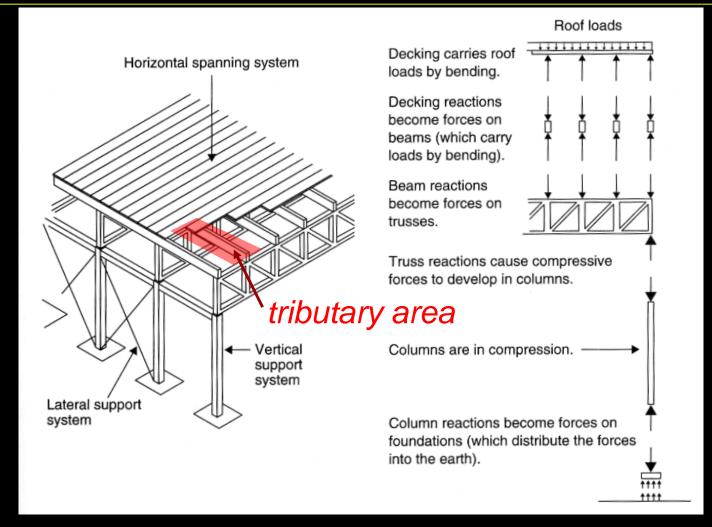

Load Tracing

- how loads are transferred
 - usually starts at top
 - distributed by supports as <u>actions</u>
 - distributed by <u>tributary areas</u>

Load Tracing

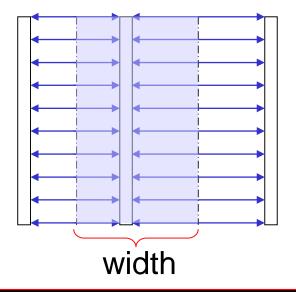

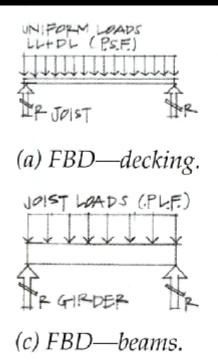

Applied Architectural Structures ARCH 631

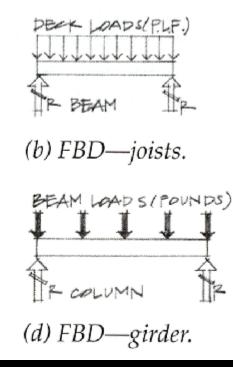

Load Tracing

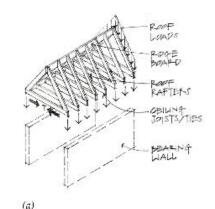

- tributary load
 - think of water flow
 - "concentrates" load of area into center

$$w = \left(\frac{load}{area}\right) \times \left(tributary \ width\right)$$

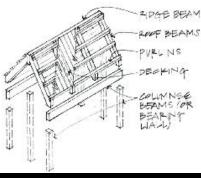

PARTER BEAMS PARTER BEAMS SEATHING SEATHING COLUMN (CR SEATHING WALL)

(c)

Applied Architectural Structures ARCH 631

• wall systems

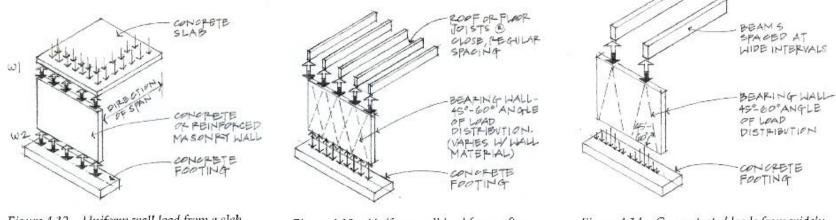

Figure 4.12 Uniform wall load from a slab.

Figure 4.13 Uniform wall load from rafters and joists.

Figure 4.14 Concentrated loads from widely spaced beams.

openings & pilasters

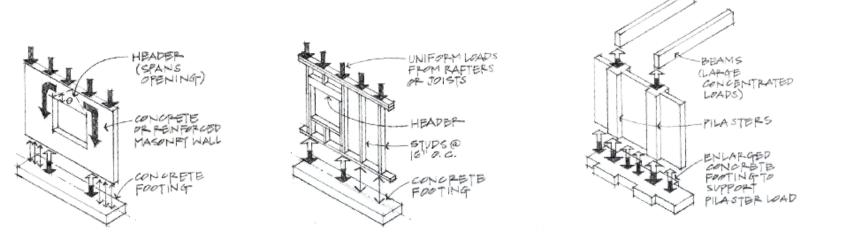

Figure 4.15 Arching over wall openings.

Figure 4.16 Stud wall with a window opening.

Figure 4.17 Pilasters supporting concentrated beam loads.

foundations

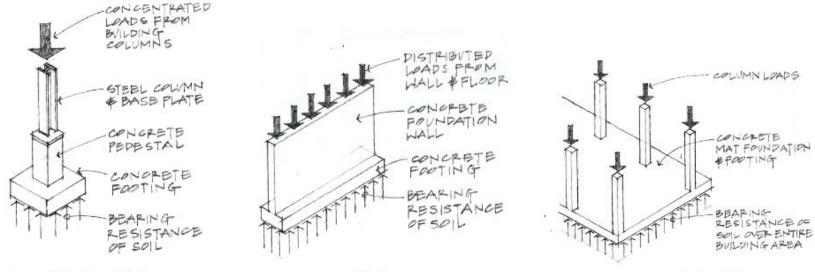

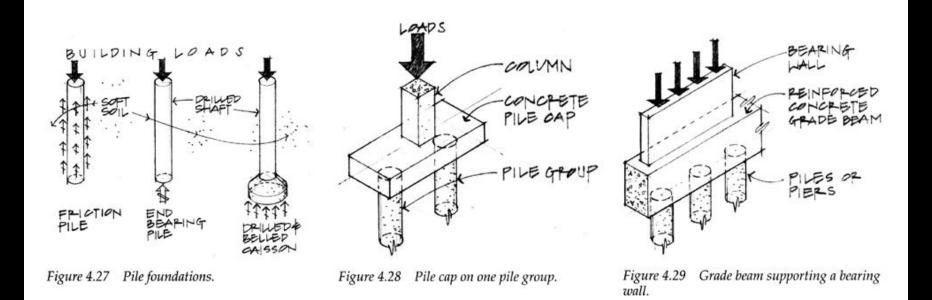

Figure 4.24 Spread footing.

Figure 4.25 Wall footing.

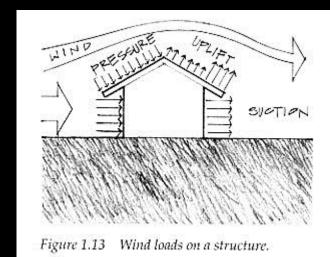

Figure 4.26 Mat or raft foundation.

deep foundations

Load Types

- D = dead load
- L = live load
- $L_r = live roof load$
- W = wind load
- S = snow load
- *E* = earthquake load

- *R* = rainwater load or ice water load
- *T* = effect of material & temperature
- *H* = hydraulic loads from soil (*F* from fluids)

ASD Load Combinations

- D
- *D* + *L*
- $D + (L_r \text{ or } S \text{ or } R)$

- $D + 0.75L + 0.75(L_r \text{ or } S \text{ or } R)$
- D + (0.6W or 0.7E)
- D + 0.75L + 0.75(0.6W or 0.7E) +

 $(0.75L_r \text{ or } S \text{ or } R)$

• 0.6D + (0.6W or 0.7E)

LRFD Load Combinations

- 1.4D
- $1.2D + 1.6L + 0.5(L_r \text{ or } S \text{ or } R)$
- $1.2D + 1.6(L_r \text{ or } S \text{ or } R) + (L \text{ or } 0.5W)$
- $1.2D + 1.0W + L + 0.5(L_r \text{ or } S \text{ or } R)$
- 1.2D + 1.0E + L + 0.2S
- 0.9D + 1.0W
- 0.9D + 1.0E

- F has same factor as D in 1-5 and 7
- H adds with 1.6 and resists with 0.9 (permanent)
